Correlations between self-esteem and intention aggression in senior high school X. (Niken Widiastuti, M.Si., Psi & Dra. Ninawati, MM.); Psychology Study Programme, Undergraduate Programme, Tarumanagara University. (64 pages, P1-P5)

Self-esteem is a positive or negative self evaluation in individuals. This self evaluation shown by the belief in oneself as a capable, important, successful and precious. Intention aggression is defined as a certainty of individual is will to act in a certain way to fulfill the motive of hurting or injuring other individuals. The objective of the research is to find the correlation between self-esteem and intention aggression students of SMU X. The result shows a negative correlation between self-esteem and intention aggression on them. This means that higher the self-esteem is, the lower intention aggression is possessed. On the other hand, the lower the self-esteem is, the higher the intention aggression is possessed.

Keyword: self-esteem, intention aggression, adolescent.
