**Description of street children's psychosocial aspect that's viewed from ecological system (Dra. Fransisca Iriani, M.Si.); Psychology Study Program. Bachelor Degree. Tarumanagara University. P1-188, L1-L5.**

This research is done for gaining the description of the street children's psychosocial aspect that's viewed from ecological system. Street children are children whose age is under 18 years old dan spend most of their times for working, playing, until running life in the street. Psychosocial aspect that's developed in adolescence is identity, autonomy, intimacy, sexuality, and achievement. Human development takes place in ecological system, which is contextual system that influences human behavior. The ecological system involves five system which includes nearest to farest environment and that systems are microsystem, mesosystem, exosystem, macrosystem, and chronosystem. This research uses interview methode, which is in-depth interview to intake its data. Subjects are five adolescents who are living in the street. Based on interview that is done to five subjects, the result shows that psychosocial aspect development is different in each subject, as well as ecological system that influences them. Psychological aspect that's most influenced by ecological system is autonomy, followed by sexuality, intimacy, identity, and achievement.
