**Microsystem-Related Aspects To The Occurance of Crime in Female Teenage Convicts (Henny E. Wirawan, M. Hum, Psi.); Bachelor Degree In Psychology, Tarumanagara University (81 pages+R1-R4).**

The case of stealing is one of criminal action done by female teenagers. The objective of this research is to find out the microsystem related aspects to the occurrence of crime in teenage convicts which based on theory of Bronfenbrenner. This research is performed in qualitative method by doing open interview to four subjects i.e. persons aged 18-21 years old. There are several environment factors which influence a person doing a criminal action. The environment factors that mostly influenced teenagers in such action are family, peers, school, and the living environment. The research reveals that relationship with the family becomes number one aspects, followed by peers, as second aspects of the microsystems which mostly influenced the action of stealing. However the peers factor will not influence the subject if there is no significant problem in the subject's family. The research shows that school and living environment will not give any influence or contribution to the four subjects when their doing the stealing.
