Self-Acceptance of Young Adulthood Women With Cervix Cancer and Have No Offspring (Henny E. Wirawan M.Hum., Psi); Undergraduate Programme in Psychology, Tarumanagara University (75 pages, R1-R4)

The research tried to describe self-acceptance of young adulthood women with cervix cancer and have no offspring. When these women judged as cervix cancer , they showed various reactions. The common reaction were getting shock and showing sadness. The interviews were conducted between March 27, 2008 until October 18, 2008 with three respondents whose age are between 27-31 years old. The research showed that in the beginning, all respondents got shock and felt so sad when they heard the doctors' diagnose. As the time goes on, finally they are able to accept their condition and all the consequences of their disease. The respondents have positive self-acceptance to face the reality.

Keywords: self-acceptance, young adulthood women, cervix cancer
