Preview influence Therapeutic program Community (TC) of Self-efficacy in the recovery process resident drug rehabilitation centers BNN, Lido West Java (Miniwaty Halim, M.Si., Psi and Dra. Ninawati, M.M.); Study Program Bachelor Degree of Psychology, Tarumanagara University, page 1-173, P1-P4.

The purpose of this research is to know the description of Self-Efficacy (SE) Resident drugs in the recovery process through a program Therapeutic Community (TC) in rehabilitation centers BNN, Lido West Java. The research subject is the fifth resident re-entry rehabilitation BNN aged between 20-35 years, and more than 10 years became junkies and had undergone previous rehabilitation. On recovery, the most difficult task is accomplished resident drug free, and the most convenient is the productivity. In the SE dimension, magnitude and generality is the highest dimension is the lowest-dimensional views of the ability to fulfill the task of recovery. Vicarious experience is the source of the SE of the most frequently encountered in residents, and mastery experience the least encountered. At the 5 pillars TC, religious session is a little pillar supporting the formation of SE, and role modeling that most supported the establishment of SE. Methods of data analysis in this study using in-depth interviews. There is no pattern of SE have been formed between residents who have never undergone TC and who had undergone TC based rehabilitation.
