Mediation Effect of Identity Processing Style in the Impact of Parenting Style to Adolescence' Psychological Well-being in Jakarta; (Bonar Hutapea, M.Si); Undergraduate Program of Psychology, Tarumanagara University.

The aim of this study is to testing the mediation effect of identity processing style in the impact of parenting style to adolescence' psychological well-being. Study were done in Jakarta by using quantitative non-experimental method. A total of 385 participants by age 17-20 years old, were asked to fill a questionnaire which including Ryff's Psychological Well-being 54 item format, Identity Style Inventory-5 (ISI-5), and Parental Authority Questionnaire (PAQ). The measurement of parenting style in this study were divided into father and mother's parenting style. The results of this study showed the mediation effect of adolescence' identity processing style in a different indication of both parent's parenting style to psychological well-being. Authoritative style implicated by mother and father contributing in adolescence' higher psychological well-being, through informative identity processing style. While father's authoritative style is more significant than mother's when regressed together. In reverse, authoritarian style implicated by father and mother both contributed in adolescence' lower PWB through normative and diffuse/avoidant identity processing style. Mother's authoritarian style is more significant than father's when regressed together.
