

## ABSTRACT

*Investment in construction in general apply for loans of development funds from the bank, but the high interest of bank loans caused difficulties for the investor in playing the interest during the construction process. It can be anticipated to accelerate the implementation of construction so as to be efficient and effective in the use of project funds. Accelerating the construction process can facilitate investors in return on capital construction borrowed from banks.*

*This urges the researchers to determine the target acceleration duration of the project and determine the influence of the cost required to accelerate. This research data obtained from consultant planners and contractors. The results obtained from the methods of acceleration is expected to reduce implementation time and is useful for analysis in the next project.*

*Keywords: acceleration of construction, project duration, costs*
