

ABSTRACT

Andri Setia Dharma (705100174)

Adaptation of Mood and Anxiety Symptoms Questionnaire Anhedonic Depression Scale (P. Tommy Y. S. Suyasa, M.Si., Psi.). Undergraduate Program in Psychology, Tarumanagara University, (i-x 59 pages, R1-R6, Appdx 1-57).

According to Watson and Clark, most of the depression scales measure negative affect which do not specific against depression. Negative affect can be found at anxiety and depression. However, this could be lead to depression scale having a high correlation with anxiety scale. Previous researces show that MASQ-AD scale has less correlation with anxiety than other depression scales. This research aim to adapting MASQ-AD scale into Bahasa. Another objective is to find out the validty and reliability of MASQ-AD scale. The Participants in this research are 227 undergraduate students at X University in Jakarta. They were asked to do the MASQ-AD, BDI-II, NEO-PI neuroticism scale and BAI. The result shows that the correlation MASQ-AD with BAI is lower than BDI-II with BAI.

Key Words: Scale, MASQ-AD, Tripartite Model, Depressions, Anxiety, Undergraduate Student.
